

World Vision Programme Framework

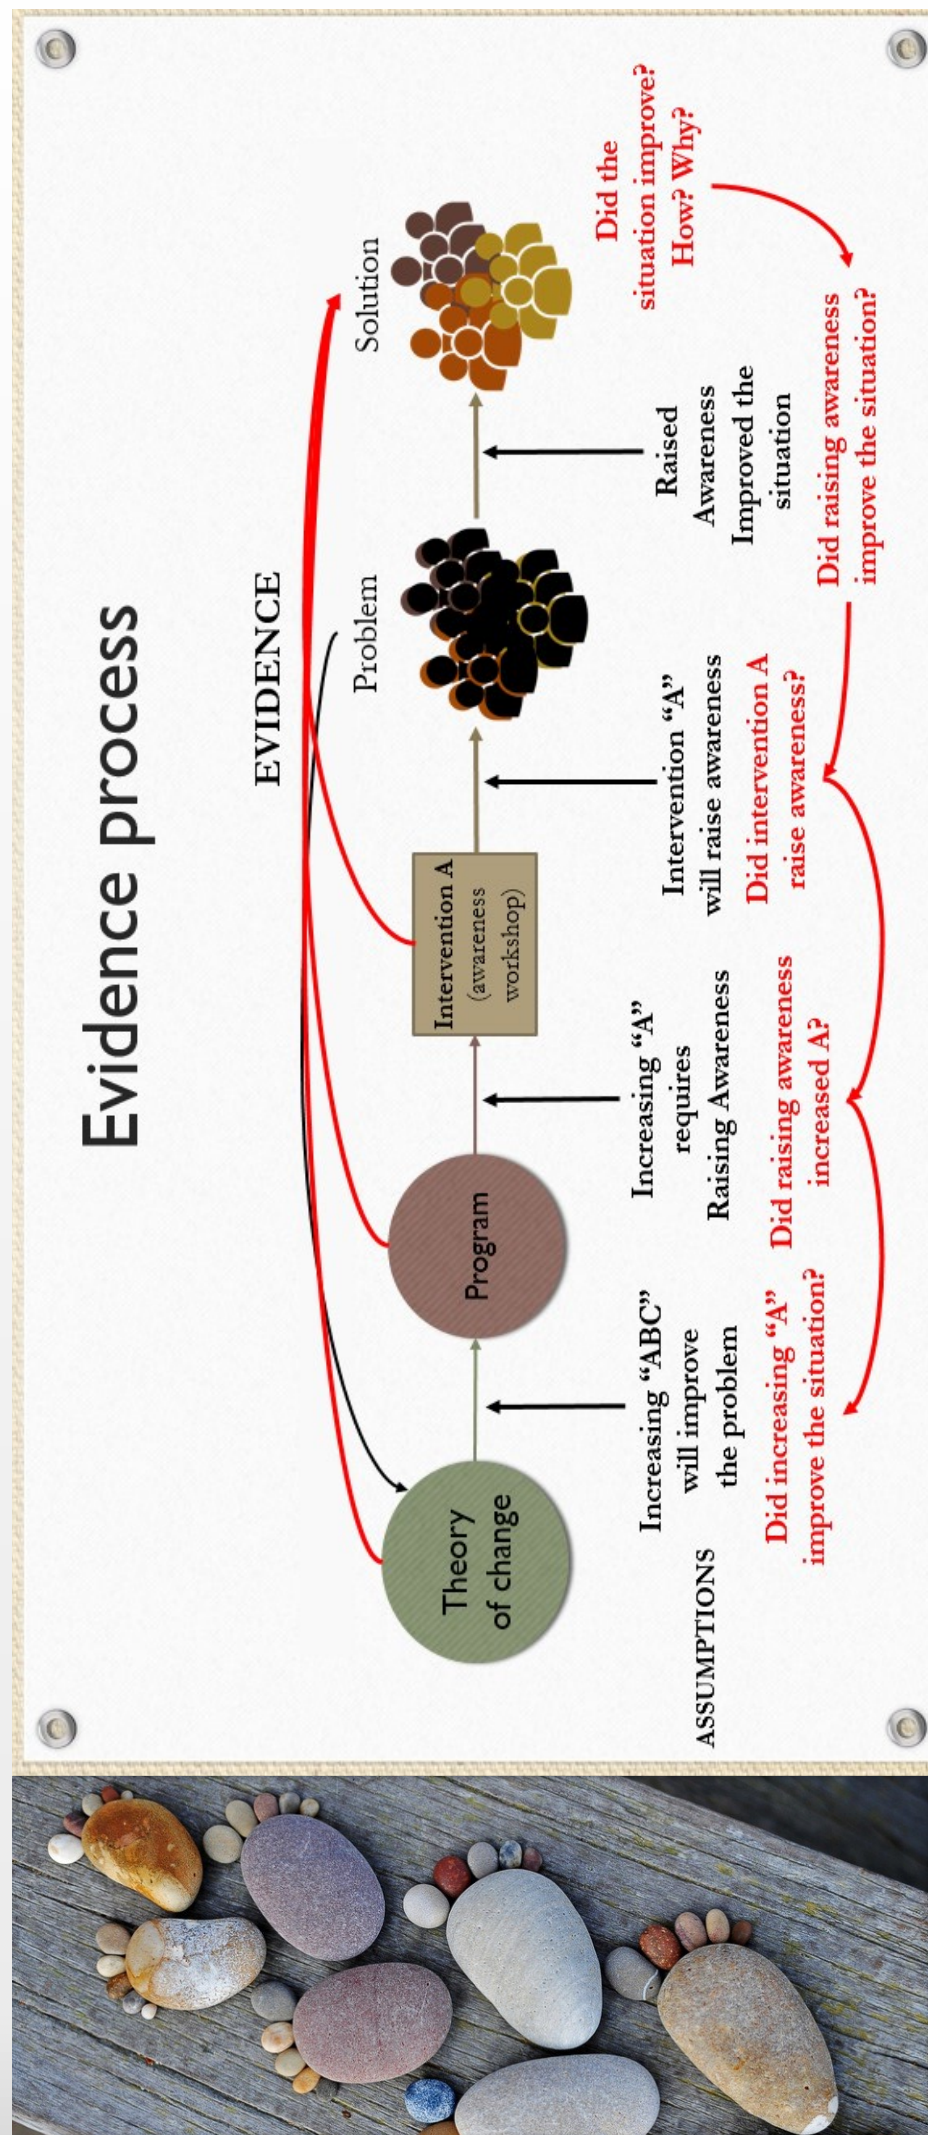

DME Management Policy

- Design, monitoring and evaluation
- Implementation and monitoring
- Baseline and Evaluation

Programming Quality Standards for NOs

- Design, monitor and evaluate
- Programme management
- Partnering and collaboration
- Technical interventions
- Participation and inclusion

LEAP 3.0

World Vision®

Programmatic Evidence

Evidence is the product of a **process** of systematically drawing a **causal link** between program interventions and **social impact**.

MEER Evidence Principles for Programmes

- **Accurate:** Can this data be validated by independent sources?
- **Precise:** Are we really measuring what we claim to be measuring?
- **Sufficient:** Is the evidence provided enough to support the claim you are making?
- **Representative:** Is the evidence representative of the population to which the claim is related?
- **Clarity of Expression:** Is the importance or significance of the data presented explained?
- **Voice & Inclusion:** Are we presenting beneficiaries views in the design and evaluations?
- **Contribution:** Are our interventions contributing to the changes we intended?
- **Transparency:** Are we open about the data, sources and methods used?

14 Steps

Roadmap for MEER

Program design

1. **Reflect** the NO priorities
2. **How** proposed interventions contribute to intended outcomes
3. **Clear targets** for each intervention
4. **Grounded** on the theory of change

Methodology

5. Selected indicators measure **causality** formulated and proposed in theory of change
6. The sample **represents** the population to which the claim is related
7. The sampling strategy is **relevant** to the hypotheses formulated in program design

8. Examine if the **targets** are met
9. Reflect information about the **implications** of the program on the overall population
10. Check **causality** between program and social impact
11. **Inform and update** the theory of change

Data analysis

12. Data presentation follows a **standardized format** so that it is consistent across reports and it is easy to extract information
13. A **peer review system** is established to confirm the validity of the analysis and data presentation
14. Reports are **disseminated** to all relevant stakeholders both internal and external

Data presentation/ dissemination
